

NOTICE OF FUNCTION CHANGE (firmware version 1.04)

The following new functions were added to the sd Quattro camera with the new Firmware update (Firmware version 1.04).

It is possible to save files in DNG format.

DNG is the RAW image data that is developed by Adobe Systems Incorporated. It is not possible to develop it on SIGMA Photo Pro, so it is necessary to use the software that is compatible with DNG files (depending on the specifications, there might be some software that may not support the DNG files taken by SIGMA sd Quattro).

- It is not possible to record the image data in DNG and JPEG simultaneously.
- It is not possible to adjust the White Balance of DNG files.
- It is not possible to select the following color modes when the file format is set to DNG.

[CINE], [Sun R.], [For G.], [Fov B.], [Fov Y.]

- It is not possible to change the Color Mode Detailed Setting when it is set as DNG.
- It is not possible to set Custom Bracketing when it is set as DNG.
- For DNG files, it is not possible to use the function to develop RAW data inside the camera.

NOTICE OF FUNCTION CHANGE (firmware version 1.02 later)

It has changed the specification to initially display selectable languages when all camera settings are reset to factory defaults with "Reset Settings".
